

We welcome English-speaking Guests and inform:

BMV or Best Music Visualization System is a system of direct analog-digital conversion of music into LED light developed by Best-System. It is a standalone system that does not require the participation of other converters. The system does not require cooperation and does not cooperate with a system of transducers with a DMX512 communication bus. BMV Best-System controllers allow for a high load of power outputs and the load ranges from 65W to 250W per output. There can be 5, 8 or 20 outputs.

The project was developed by Polish engineers. Please watch the films and familiarize yourself with the operation of the BMV controllers. We invite you to cooperation.

Note: The translation from the Polish language has been done automatically and some words may not be translated precisely.

Please see the tabs of the VIDEO and PRODUCTS pages.

Regards on behalf of Best-System.
